Alexander Merlo

(561) 752 - 6111 | alexmerlo23@gmail.com | My Portfolio | Linkedin | Github

Education

University of Florida Gainesville, FL
Bachelor of Science in Computer Science, 3.75 GPA Graduated: May 2025

Technical Courses: Software Engineering, Data Structures and Algorithms, Algorithm Design, Computer and Information Security, Database Systems, Machine Learning, Human-Computer Interaction, and Operating Systems

Technical Skills

Languages: JavaScript, HTML, CSS, SQL, Python, C++
Stacks: MERN (MongoDB, Express, React, Node)
Technologies: Git/Github, Oracle SQL developer, VS Code, JetBrains, Various LLMs, REST APIs
Libraries: Tailwind, Jest, Pandas, Matplotlib, NumPy

Experience

R+L Global Logistics | Application Support Engineer July 2025 – Present

- Managed ~1700 support conversations and personally resolved ~1,300 over a 7-month period (Sep 1st 2025 - Feb 28th 2026), maintaining an average first response time of 4 minutes. Developed proficiency across many software platforms to provide support throughout all stages of the company's business lifecycle.
- Worked alongside the development team to diagnose software issues. Reviewing code when necessary to troubleshoot various API connections (ex. Front and Pipedrive APIs).
- Played a key role in an initiative to reduce the cost of Cargowise, my primary responsibility was auditing user licenses and eliminating waste to save the company. I accomplished this with almost no friction on daily users.
- Completed training courses for various logistics and operations platforms: Cargowise, Deposco, and McLeod

UF Software Engineering Club | Tech Officer - Clubfinity Oct 2024 – July 2025

- Implemented UI redesign based on Figma prototypes from the UX/UI team, improving user experience for managing profiles, followed clubs, and social media links.
- Integrated full-stack futures, modifying database schemas and API routes to support new frontend futures.
- Completed a 4-week onboarding course in MERN and React Native development, gaining proficiency in full-stack development within a large multiplatform codebase aligned with the club's coding standards.

Personal Coding Projects

Food Genie | *Human-Computer Interaction* Fall 2024

- Integrated the Spoonacular API with React to fetch over 5,000 recipes, 2,600 ingredients, and nutritional information. This gives users an intuitive UI for personalized recipe recommendations based on their dietary needs.
- Utilized knowledge of full-stack development from previous projects to create and deploy this application in under a week.

OnTask | *Introduction to Software Engineering* Fall 2024

- Led a team of 4 developers to build a full-stack calendar application using MERN. Solidifying my skills in software collaboration and management by utilizing GitHub to merge 100+ team contributions.
- Created a CRUD API to manage our MongoDB database. This database allowed for user authentication, various account types (teacher or student), and custom calendar events with titles, content, and colors.

Weather Me This! | *Information and Databases Systems* Spring 2024

- Collaborated with a team of 5 developers to build a full-stack app that uses over 2,000,000 rows of compiled data to display complex weather trends.
- I aggregated and preprocessed data using Python with Pandas. This allowed me to implement SQL queries using Oracle Developer to extract, filter, and analyze weather data, driving insights for graph visualizations.

Arduino Robot Arm | *Personal Project* Fall 2024

- Learned Arduino (C++ variant) to connect servo motors with controllers for robotic arm movements.
- Gained hands-on experience with computer engineering concepts, including embedded programming, breadboard prototyping, and Arduino Uno integration.
